02 ABOUT

I am an industrial designer with a strong technical grounding in mechanics and manufacturing and a human-centered approach to usability and function. Experienced in strategic and service design across diverse fields, leading initiatives from concept to production. Brings genuine enthusiasm and a positive, collaborative approach to every project.

03 EDUCATION

MSc - Industrial Design
LUT University, Lahti, Finland
2021 - 2025

BSc - Engineering Product Design
London South Bank University, United Kingdom
2016 - 2019

Vocational qualification - Electrical & Automation Technology
Hyria Education, Hyvinkää, Finland
2011- 2014

04 EXPERIENCE

Industrial Designer • Creo Center Oy 1/2025 - 8/2026
Espoo, Finland

Industrial and Mechanical Designer responsible for product development from concept to production release, including product geometry creation, prototyping, manufacturing documentation, and comprehensive environmental and functional validation testing to ensure product performance and reliability.

Senior Designer • Seos Design Oy 3/2023 - 12/2024
Espoo, Finland

Led industrial and service design initiatives from research and concept through implementation, aligning stakeholder needs with user-centered solutions that improved customer experience, product value, and business outcomes.

Industrial Designer • Seos Design Oy 11/2020 - 4/2023
Espoo, Finland

Industrial and service designer on client projects spanning startups to large corporations across B2B, consumer, and medical device sectors. Contributed everywhere from focused design support to leading full turn-key solutions, working across the complete industrial design process from conceptualization and prototyping to documentation, production & launch.

Packaging Designer • Kite packaging Ltd 11/2019 - 3/2020
Sittingbourne, United Kingdom

Managed the complete packaging design process from client brief to fruition, delivering bespoke solutions for B2B, food and beverage and medical clients. Combined industrial and graphic design expertise and created visualizations to communicate concepts with stakeholders, including manufacturers and clients.

Trusted by

Over 40 clients across Finland and the UK,
delivering design concepts, branding, service
design, graphic design, and packaging design -
from early ideas through to market-ready products.

Design awards

reddot winner 2024

reddot winner 2025

reddot winner 2026

Q-Flow 1 examination lamp and Q-Flow 2 surgical lamp for minor surgical procedures performed outside main operating theatres.

Led the design of a luminaire that extends Merivaara's design language, translating the brand's commitment to ergonomics, usability, and cleanability into form.

red**dot** winner 2024

Industrial design | Mechanical design | User interface | Ergonomy analysis | Usability

Simplification

Draft form by the client
with internal components.

Re-designed form and
new component layout.

The form was re-designed to reduce visual complexity and create a cleaner, more cohesive aesthetic. Simplified geometry also minimizes contaminant traps along parting lines, improving cleanability and reducing infection risk.

Usability and Ergonomics

The luminaires deliver excellent tissue colour rendition, with single-hand operation that minimizes disruption to caring staff, and a removable, easy-to-sterilize handle.

Modularity

The modular architecture enables integration with existing procedure-specific arm systems, enhancing ergonomics while accommodating diverse surgical environments.

Evaka approached the studio to launch a home electric vehicle charger under an entirely new consumer brand. The scope spanned product design, accessories, a mobile app, and brand identity.

Developed in close collaboration with the client to create a design language that translates consistently across every touchpoint, from hardware to UI.

Industrial design | Mechanical design | Ergonomics analyses | UI/UX | Branding | Brand guide

Background and Research

With target market and product segment defined by the client, I clarified the vision through a competitor insight analysis, visualizing the findings to align the team's understanding.

Concept Generation

I researched transportation trends, aesthetics, and functionalities anticipated over the next five years, then communicated concept directions through sketches and moodboards.

Industrial Design

Grounded in strategic brand drivers, the identity merges clean Scandinavian design with a powerful, contemporary edge. Faceted exterior geometry interacts with light, casting shadows that shift with the surrounding environment.

Ergonomic analysis shaped plug and indicator placement for comfortable daily use, while durability and cleanability were built in from the start. An angled plug and self-closing cover guard against rain and splashes.

Mobile app and User Interface

The charger extended into a digital dimension, controllable via a companion phone app. We developed the information architecture, flow charts, and graphical design, which were handed off to an external software developer for build.

The interplay of light and shadow carries through to the brand's graphical layer, where subtle gradients suggest three-dimensionality and add character without visual clutter, creating a cohesive transition from physical charger to digital interface.

Brand Identity

The project delivered an entirely new consumer brand, launched from scratch. As a team, we owned the full scope of brand development - name, logo, brand guidelines, and industrial design guidelines. Branding, industrial design, UI, and mechanical design were developed in parallel as one collaborative effort, producing a cohesive brand ecosystem alongside a durable and stylish charger.

Amid the COVID-19 pandemic, Sharkmedical set out to develop a solution to prevent respiratory infections in healthcare settings. A simple disposable isolation concept evolved, through iterative development and end-user research, into ShareGuard99® - a Class 1 CE-marked medical device for individual air purification and isolation, and the company's first proprietary product.

Industrial design | Prototyping | End user testing | Brand identity | Brand guide | Packaging | Manuals | Regulatory standards

Industrial Design Process

Form development progressed through repeated iterations, sketches, 3D modelling, visualizations, and prototyping - refined alongside end-user research and usability testing to shape the final device.

End User Testing

Testing sessions were conducted with various end-user groups and stakeholders throughout the process - a requirement under medical device development standards, and consistent with the IEC 62366-1 usability standard applied to the product.

Instructions and Support Material

User manuals and instructions for use were developed across multiple formats. Video, electronic files, printed materials, and packaging - each aligned with the brand's visual and communication guidelines.

Brand Identity

A new brand was created with its own distinct identity, supported by a full suite of materials - brand guide, website, product catalog, roll-ups, and posters.

Service Model

Product Visualizations

Renderings used to represent the product across marketing and communication materials prior to product photography.

Incight Biomedical's JEDI solution uses smart optical sensors - combining near-infrared spectroscopy and AI - for objective assessment of tissue integrity in orthopaedic joint surgery. The device enables rapid, non-destructive diagnosis of tissue pathology without compromising surgical workflows, replacing subjective visual assessment with earlier, more informed detection of joint damage.

Product Concept

The brief called for a refined, trustworthy product concept for the examination instrument and its associated arthroscopy devices.

Through market research and design thinking, the concept evolved into a modular, mobile, and easily reconfigurable tower structure, consistent with equipment already familiar in hospital environments.

Digital User Interfaces

Interactive user interfaces were conceptualized in line with the brand and the client's requirements, enabling the client to communicate their vision to prospective investors and partners.

Use Case Visualizations

Concept visualizations showing the probe and system in a real-world use scenario.

The scope was to design a digital shower controller as part of the wider I-Shower concept. The controller integrates with the Uponor Combi Port heat interface unit (HIU) to improve comfort, energy efficiency, and water hygiene. With the shower controller market saturated with similar products, the aim was to differentiate through form and usability that strongly reflects Uponor's design DNA and brand values. The project has since won three major design awards.

Design and Form

The product was developed around Uponor's design DNA. A slim, symmetrical form that installs easily alongside any showerhead, with soft, rounded touch points for pleasant interaction. Gaps and parting lines are minimized for easy cleaning, and durable materials withstand common bathroom chemicals.

Final Product

Available in a range of colour options to suit different bathrooms, with a timeless overall look. Surfaces are designed to work equally well in high-gloss, reflective finishes and matte satin alternatives.

uponor

The project was to update the Uponor Smatrix thermostat with a solution that strengthens the company's design DNA and communicates its brand values through appearance and a clear, intuitive user experience.

In a mature thermostat market where many competing products look and feel alike. The product has since won a Red Dot Design Award.

red**dot** winner 2026

Design and Form

The design pairs a minimalist appearance with intuitive interaction. The capacitive touch interface, clear display, and slim 86 × 86 mm form that blends into modern interiors. An integrated humidity sensor and routine-learning algorithm optimize comfort and energy efficiency automatically.

SAVOX

Savox has a core mission to provide advanced communication solutions that save lives and enhance operational efficiency in most demanding environments. My roles in various project were environmental testing, mechanical engineering and industrial design.

Environmetal testing

I conducted in-house environmental testing in accordance with MIL-STD-810H. Additionally, I was responsible for the company's official test plans governing formal qualification testing - subsequently performed by accredited external test laboratories.

Motorola HS700Ex and HS750Ex

Concept development and product visualizations for Savox headsets customized for Motorola. Both models are ATEX/IECEx approved for gas and dust environments and built to perform in extreme temperatures, with various attachment configurations to suit different use cases.

SAVOX

Product Visualizations

Various design concepts and product visualizations delivered for long-standing Savox client, Motorola.
